2024 Growing Season Notes

Welcome to the 2024 Yield Book. We will try to put the season into context and share the things that we observed this growing season. We believe many of you will share in these observations on your own farm.

It's hard not to start with the fact that we had multiple planting windows this spring. Planting dates certainly impacted the challenges you faced and also final yield. The early April window was characterized by excellent soil moisture and a nice seed bed to plant into. The second April planting window saw warmer soil and overall good planting conditions; however, this planting date was followed up with a lengthy period of too much rain and saturated soils. The middle of May window obviously saw warmer soil temperatures. Some of the most uniform stands we observed were from the mid-May planting date.

According to FieldView, at one location we had eight inches of rain from the early April window to the later planting window in May. This location reported 33 inches of rain for the season ending Oct. 1st. It's important to understand that the earlier plantings had to endure too much rainfall as seedlings. The amount of drainage in a field had a big impact. The opportunity for soil-borne diseases was high. The reality is that nitrogen losses were also high. In many situations, in-season nitrogen applications provided significant yield response. There are success stories with many different nitrogen management practices, but overall, a lack of nitrogen was an issue in many fields.

Most growers will tell a story of a field that was incredibly good and a field that was disappointing. Expectations were high as it felt like the timing and the amount of rainfall was ideal during the growing season. However, so many variables were created by saturated soils early and also the wide swing in planting dates.

Soybean yields left most growers wanting a little more. The common sentiment was that bean yields were "good enough, I shouldn't complain, but I was hoping for more."

September was a particularly dry month for Iowa, breaking the record set back in 1939. There were 25 National Weather Service stations with a reporting period of more than 100 years that had their driest September on record. This type of finish led to an early harvest of grain, much drier than normal (too dry).

This year we did observe heavy pressure from tar spot in corn. A heavy presence of crown root rot and stalk rot were also observed. Many growers experienced benefits from fungicide applications, with some making two applications.

Sudden death syndrome and white mold were observed in soybeans. Foliar fungicides and micronutrients had a big impact on soybean yields this year. We believe that soybeans are being impacted by soil-borne diseases without easily observable symptoms. That is why fungicide and foliar applications are helping yield.

Rootworm pressure has been observed as it continues to move south. This should be a consideration when planning how to manage next year's corn crop.

Many farmers have removed some very high yields from their fields. Please be sure to identify the fertility that was also removed. We see many soil tests that are low and falling in pH and P & K.

The takeaways from the 2024 corn crop are: too much rain early and marginal planting conditions impacted plant uniformity and denitrification. We saw too much yellow corn in August! Tar spot took a lot of yield in a lot of fields. A lack of late August and September rain limited yields in many soybean fields. The same lack of rainfall also impacted the level of root disease in some corn fields.

Once again, you have persevered through many challenges. 2025 will also bring challenges. Optimistically, most input costs are stable, interest rates are falling, and commodity prices are strengthening, especially corn. We hope you will allow our team to help you make the best plans possible for 2025 and look forward to another season with optimism and enthusiasm.

2024 Yield Data

We have tried to put together yield results that are accurate and complete. We have mentioned before that our goal is to present this information from numerous replicated plots in and surrounding the areas that you farm, because we understand that plot data can represent local environment as much as product performance. That was especially true in 2024, as even a few miles of distance could make a big difference in moisture. We are confident that these results provide a broad set of information and believe it can be a very useful tool to you the grower. You will note that the Pro Grower Solutions (PGS) summary shows each location that was used in the results. You will also see the number of times each hybrid/variety was replicated (repeated). We have also included results for 2023 and 2022 for the relevant products and how many times they were replicated in those years. This provides two and three years of data for those products. There is a great deal of information on these pages, and we hope that you will look at them closely and call us if you have any questions.

We have also included the FIRST trials summaries for Iowa East Central, Iowa South, Illinois West Central, and Illinois North. You will also find summaries from Iowa State University trials, Illinois University yield trials, and from First Mid Ag Services. Finally, we have included a few local trials done by respected growers who graciously shared their information with us. These are all independent trials, and we hope you find all of this information useful.

There are many things we can learn from this growing season. We again saw the value of keeping plants alive in both corn and beans. This was achieved through product selection, fertility and the use of fungicide. We also saw the value of hybrids with strong roots and stamina under stress. The quality of the genetics we plant and attention to detail can help overcome many of the challenges that farmers experience. We hope that you will allow us to help you achieve a higher level of profitability on your farm.

Hybrids sorted by the Zone Summary based on gross dollars minus drying costs. Yield is calculated at 15% moisture using a 1.4% shrink factor. Gross Dollars are calculated at \$3.75 per bushel minus \$0.045 per point of moisture drying factor.

Hybrids in bold are 105% + of plot average (\$).
